AgriWin Ltd

Company research summary
Rwanda agribusiness and agricultural extension company

Interviewee: Ngamije Vincent
Head Of Planning, Monitoring, and Evaluation at Agriwin Ldt

How AgriWin started

From student ideas to a horticulture-focused private extension business

2017

AgriWin says the idea was formed by students in a cross-border “learning by doing” agriculture programme inspired by Israeli agriculture.

Early start

Sector research says the founders were young agriculturalists returning from horticulture studies at Kinneret College in Israel.

First model

They began with nurseries and sold mango, avocado, and macadamia seedlings before expanding extension work.

Seedlings were the company’s first commercial entry point.

Why they chose this agriculture challenge

Their mission is to help move farming toward innovation, quality, and markets

AgriWin presents itself as a company built to improve Rwandan agriculture through modern practice rather than traditional subsistence-only farming.

- Build high-productivity agro-nurseries in Rwanda
- Maintain both quantity and quality of agricultural produce
- Create farmer and student awareness through training for sustainable production
- Promote mechanization, improved inputs, and value addition
- Link producers to markets inside and outside the country

What are their daily operations

Seedlings, consultancy, orchard support, and agricultural extension

AgriWin's public service list shows a business built around nursery production plus field-level advisory work.

- Produce fruit-tree seedlings
- Produce herb and spice seedlings
- Provide quality seed production consultancy
- Advise on urban farming
- Deliver extension services and farmer trainings
- Train farm managers and workers on fruit and nut production

What are some of the challenges they are facing/faced

Public sources give stronger evidence for company-type challenges than for a detailed internal challenge log

Most credible challenges mentioned in sector reports for youth-led private extension firms like AgriWin:

- Building capacity as a young private extension company
- Limited financial and human resources among youth-led firms
- Relatively low use of digital tools in this extension model
- Exposure to broader agriculture shocks in Rwanda, including drought and rising input costs

What success looks like for AgriWin Ldt

The strongest evidence comes from staffing, client reach, and nursery-scale project delivery

20 extension staff in the youth agripreneur study
all youth; 45% female

12 large-scale farmers served
plus nursery-operator training across five districts

45,678 avocado seedlings distributed
to 15,226 households in a later IFAD-linked report

78 avocado nursery beds established
across seven districts in partnership work
